

BRAND PRESENTATION

FEDSEC
KNOW YOUR RISK

INTRODUCTION

In an increasingly connected world, cybersecurity is no longer limited to protecting systems and networks. It is about protecting the trust, information, people, and operations that organizations depend on. FEDSEC was created with this understanding. We are a multidisciplinary cybersecurity firm built around the belief that effective security requires more than one perspective.

By bringing together professionals with different areas of expertise, we approach cybersecurity as a collective, combining technical knowledge, strategic thinking, and practical security solutions. Our foundation is trust. Our strength is expertise. Our advantage is collaboration.

The following defines who we are, why we exist, what we do, and the vision that guides FEDSEC as we build toward becoming a trusted name in cybersecurity.

WHO ARE WE

FEDSEC is a multidisciplinary cybersecurity firm bringing together professionals with diverse expertise to help organizations understand, manage, and strengthen their cybersecurity.

WHY DO WE EXIST?

We exist to make effective cybersecurity more accessible, practical, and actionable by helping organizations identify risks before they become serious threats.

WHAT DO WE DO?

We provide cybersecurity services across vulnerability assessment and penetration testing, security analysis, GRC and advisory, network security, software security, and other areas of cybersecurity.

WHO DO WE SERVE?

We serve startups, SMEs, technology companies, institutions, and organizations that rely on digital systems and need to protect their data, infrastructure, applications, and operations.

COMPANY

OUR MISSION

To provide trusted, practical, and multidisciplinary cybersecurity solutions that help organizations identify risks, strengthen their security posture, and operate with greater confidence.

OUR VISION

To become a trusted cybersecurity firm recognized for bringing together diverse expertise, delivering practical security solutions, and contributing to a more secure digital ecosystem.

WHAT MAKES US DIFFERENT?

FEDSEC brings together different cybersecurity disciplines under one collective. By combining offensive and defensive security perspectives with GRC, network, software, and other areas of expertise, we approach security from multiple angles rather than a single point of view.

In one sentence:

FEDSEC is built on trust, driven by expertise, and strengthened by collaboration.

The logo features the word "FEDSEC" in a bold, sans-serif font. "FED" is white and "SEC" is red. Below it, the tagline "KNOW YOUR RISK" is written in white, all-caps, sans-serif font. The background is a dark purple rectangle with a gradient, and there are light blue geometric shapes in the corners.

FEDSEC

KNOW YOUR RISK

OUR VALUES

At FEDSEC, our values guide how we work, how we serve our clients, and how we conduct ourselves as security professionals. We are built on **trust, integrity, confidentiality, professionalism, collaboration, continuous learning, and accountability.**

Our Core Values

- **Trust**
We build relationships through reliability, transparency, and responsible security practices.
- **Integrity**
We do what is right, even when no one is watching.
- **Confidentiality**
We protect the information, systems, and access entrusted to us.
- **Professionalism**
We approach every engagement with discipline, competence, and respect.
- **Collaboration**
We believe different perspectives and areas of expertise create stronger security outcomes.
- **Continuous Learning**
We remain committed to learning, adapting, and keeping pace with an evolving threat landscape.
- **Accountability**
We take responsibility for our work, our decisions, and the outcomes we deliver.

OUR SERVICES

- **FEDSEC provides practical cybersecurity services designed to help organizations identify vulnerabilities, understand their risks, strengthen their security posture, and make informed security decisions.**
- Our initial service areas include:
- **Vulnerability Assessment & Penetration Testing**
Identifying vulnerabilities and testing security controls through authorized security assessments.
- **GRC & Cybersecurity Advisory**
Helping organizations understand security requirements, identify gaps, improve processes, and establish stronger security practices.
- **Security Analysis**
Analyzing systems, security events, logs, and potential threats to help organizations detect and respond to security risks.
- **Network Security**
Assessing and strengthening the security of network infrastructure, configurations, and connected environments.
- **Software & Application Security**
Identifying security weaknesses within applications, APIs, and software systems throughout their development and deployment.
- **Cybersecurity Education & Awareness**
Helping organizations and individuals develop stronger cybersecurity knowledge and safer security practices.

OUR TEAM

AGNES AKPA

CYBER SECURITY ANALYST

Agnes operates at the intersection of technical security, risk governance, and business strategy. With experience spanning application development, cloud security, DevSecOps, blockchain security awareness, and secure system architecture, she brings a practical technical perspective to GRC that most compliance-focused analysts lack.

She currently serves as Head of Security at FiatRouter and previously built cloud infrastructure as a Cloud Computing Intern with NITDA's IT Hub, backed by certifications including (ISC)² Certified in Cybersecurity, a DevSecOps certificate from TryHackMe, and Google's Cybersecurity Certificate.

She helps organizations translate complex cyber risk into clear, actionable security strategy, building frameworks that align business objectives, compliance requirements, and real-world security operations.

Technical depth. Risk governance. Business alignment.

BADU ZACCHEAUS J.

CYBER SECURITY ANALYST

A cybersecurity analyst with hands-on experience testing production systems uncovering misconfigurations, insecure headers, and web application flaws, and turning findings into clear, actionable reports for stakeholders.

He pairs practical, tool-driven testing with academic research, including a project on browser extension threat detection. He's part of the discipline behind FEDSEC's methodology: authorized, documented, and built to hold up under scrutiny.

ANIH KOSARACHI CLEMENT

SOC ANALYST

A cybersecurity graduate of the Federal University of Technology, Minna, with a strong foundation in security monitoring, alert triage, incident analysis, and threat detection. Clement approaches security problems methodically, investigating alerts, validating findings, and understanding attacker behavior to identify risk before it impacts business operations.

He brings a solid grounding in SIEM concepts, logs versus events, IOCs, and endpoint behavior, paired with the collaborative instincts fast paced SOC environments demand. He's building toward incident response, threat hunting, and detection engineering, anchoring FEDSEC's defensive security capability.

OLOWOLAGBA PETER

NETWORK SECURITY ENGINEER

A network security specialist with hands on experience across enterprise networking and IT security operations, gained through internships with Stanbic IBTC Pension Managers' Network and IT Security teams.

Peter has worked with Cisco core switching infrastructure, SD-WAN device management, and network monitoring platforms like SolarWinds and ManageEngine, alongside exposure to enterprise security tools including Forcepoint, Trellix ePO, Check Point SmartConsole, and Imperva DAM.

He's currently pursuing his CCNA certification, building on a solid foundation in network security fundamentals, access control, and firewall operations. He brings enterprise grade network defense experience to FEDSEC's technical bench.

ABANG OBED

LEAD SECURITY ENGINEER

Six years across security operations, application security, offensive security, and detection engineering, spanning web, API, mobile, network, cloud, and Windows internals.

Obed has secured government infrastructure at Nigeria's National Emergency Management Agency, holds the Certified Penetration Testing Specialist (CPTS) credential, and has been credited on GitHub's and X's official security advisory programs for critical vulnerability discoveries.

He brings the range that lets FEDSEC move fluidly between red team engagements, SOC operations, and the software engineering depth needed to build the tooling behind them.

A portrait of Isah Dauda, a Black man with short dark hair and a light beard, wearing a white dress shirt, a blue and white striped tie, and a maroon vest. He is standing with his arms crossed and a watch on his left wrist.

ISAH DAUDA

FULL STACK DEVELOPER & SECURITY RESEARCHER

A researcher and full stack blockchain engineer who audits from the inside out, tracing vulnerabilities through architecture and business logic rather than relying on scanners alone.

Isah holds the CAP and CNSP certifications, actively hunts bounties across Cantina, YesWeHack, and Bugcrowd, and has competed in public audit contests on protocols like the XRP Ledger. His work bridges Web2 and Web3 attack surfaces, giving FEDSEC coverage in an area most traditional security firms can't touch.

RIDWAN ADEBAYO

PENETRATION TESTER

A cybersecurity adviser and penetration tester with over five years of hands on experience in offensive security, vulnerability research, and security programme advisory. Ridwan currently advises Nigeria's Police Force National Cyber Crime Center on vulnerability management and leads penetration testing across government systems, alongside an independent practice spanning web, mobile, network, and cloud engagements.

He's an active bug bounty researcher with 35+ accepted reports across Bugcrowd and YesWeHack, holds certifications including eCPPT, eWPT, CNSP, and Google's Associate Cloud Engineer, and brings deep cloud and DevOps fluency across AWS, GCP, and Azure that grounds his advisory work in how modern infrastructure is actually built and attacked. He rounds out FEDSEC's advisory strength, translating technical risk into the kind of executive level recommendations clients act on.

NWACHUKWU FRANCIS O. FOUNDER/TECH LEAD

A cybersecurity analyst and CTF player ranked in TryHackMe's top 2%, with hands on experience spanning network security, threat analysis, and SOC operations across infrastructure, professional, and forensic environments.

Francis holds a stack of credentials including SOC Level 1, APIsec Certified Practitioner, Practical Ethical Hacking, Cisco Network Defense, and HCIA Cloud Security.

Beyond the technical work, he shapes how FEDSEC shows up publicly, leading social media strategy and creative design so the brand's online presence carries the same precision as its engagements.

OUR BRAND STORY

FEDSEC was born from a simple idea: cybersecurity is stronger when different areas of expertise work together.

The name FEDSEC represents the foundation on which we want to build the firm.

FED is inspired by the Latin word *fiducia*, representing trust, confidence, and reliance.

SEC represents security, the core of what we do.

Together, FEDSEC represents our belief that **trust is fundamental to security.**

Our visual identity reflects this philosophy. Purple, created through the combination of blue and red, represents the coming together of defensive and offensive security perspectives.

But FEDSEC goes beyond Red Team and Blue Team.

It represents the integration of different cybersecurity disciplines, different professionals, and different ways of thinking into one collective.

Different expertise. One collective.

OUR APPROACH

At FEDSEC, we believe effective cybersecurity begins with understanding the organization, not simply looking for vulnerabilities.

Our approach is built around five principles:

Understand

We first understand the organization's systems, environment, objectives, and security concerns.

Assess

We identify vulnerabilities, risks, gaps, and weaknesses through structured security assessments.

Analyze

We examine findings within their wider technical and business context.

Recommend

We provide practical recommendations that organizations can realistically implement.

Strengthen

We work toward helping organizations improve their security posture and become more resilient over time.

Our goal is not simply to find problems. It is to help organizations understand them and know what to do next.

OUR FUTURE

FEDSEC is being built with a long-term vision. While we are starting with a focused set of cybersecurity services, our goal is to grow into a broader cybersecurity firm capable of supporting organizations across multiple areas of security.

As we grow, our capabilities may expand into:

- Advanced Penetration Testing & Red Team Operations
- Security Operations & Managed Detection
- Application & API Security
- Cloud Security
- Incident Response
- Threat Intelligence
- Security Awareness & Training
- Advanced GRC & Compliance Advisory
- Cybersecurity Research
- Security Products & Solutions

Our future is not about simply offering more services.

It is about building deeper expertise, stronger partnerships, better solutions, and a cybersecurity organization that organizations can trust.

FEDSEC

Built on trust. Driven by expertise. Strengthened by collaboration.
